Technical Document

Document Search Architecture

A document search system processes different file formats.
Text extraction converts PDF and Word documents into plain text.

Text Chunking

Large documents are divided into smaller text chunks.
Each chunk contains a limited number of tokens.
Overlapping chunks help preserve context between sections.

Vector Embeddings

Embedding models convert text into numerical vectors.
Similar meanings produce vectors that are close together.

Search Process

The search system converts user queries into embeddings.
It compares query vectors with stored document vectors.
The most relevant chunks are returned to the user.
